IMPORTANT NOTE: Our grower works hard to ensure that everything we've ordered is grown successfully. However, Nature is unpredictable. The native plant species included in this list, and their availability, is subject to change due to potential germination issues and variable spring growing conditions. This list will be updated to reflect any changes in available species. In the event we are not able to fulfill part, or all of your your order, we (1) reserve the right to make appropriate substitutions in the collections and (2) you will receive a refund for any individual species in plug packs that we are not able to provide. We apologize in advance for any inconvenience and we thank you for your flexibility and understanding.

\$8.25 - 3 PLANT PACK**

My List	Scientific and Common Name	<i>*Click on common name for link to detailed plant information</i>	Life Cycle	Native Habitat	Soil Moisture	Light	Color	Height	Bloom Range
---------	----------------------------	---	------------	----------------	---------------	-------	-------	--------	-------------

**Key to Native Habitat and Definitions**

Woodland (WO) - Dominated by trees ranging from closed canopy (no or few gaps, low light level) to open canopy (some to frequent gaps, varying light levels).  
 Floodplain in Woodland (FL) - A subset of woodlands, areas that are permanently or seasonally flooded along rivers, streams and creeks.  
 Savanna (S) - Moderately to widely spaced trees with moderate to high light levels and a grass/herbaceous plant understory.  
 Prairie (P) - Dominated by grasses and heraceous flowering plants.  
 Wetland (WE) - Permanently to seasonally flooded with saturated soils for most or all of the year.  
 Open Wetland Habitat (WEO) - Open habitat including marsh, fen, sedge meadow and seep.  
 Forested Wetland Habitat (WEF) - Shrub or tree canopy including flatwoods, swamp, and forested seeps/fens not necessarily associated with floodplain.

**Key to Soil Moisture and Definitions:** Soil moisture is based on the water table level and the presence of available water for plant growth. Soil moisture is determined by regional climate and affected by soil type (clay slowly drains, loam moderately drains, sand quickly drains).

Dry (D) - Excessively drained, such as sandy soil. Little water retention, moist for only brief period after rain.  
 Dry Mesic (DM) - Medium dry, well drained. Water available to plants for a short period after rain.  
 Mesic (M) - Medium moist, comparable to average garden soil. Water available to plants for a moderate period after rain.  
 Wet Mesic (WM) - Medium moist to soggy most of the year, through significant parts of the growing season. Water drains slowly.  
 Wet (W) - Soggy or marshy most of the year. Water table is at or above surface all year.

**Key to Light Level and Definitions**

Full Sun (FSU) - Sun all day but most plants will do well with six hours or more of direct sun  
 Part Sun (PSU) - Partially shaded, typically along wooded edges and openings between trees  
 Part Shade (PSH) - Sun for part of the day, shade for the remainder  
 Light Shade (LSH) - Indirect sun, light or dappled shade all day long  
 Shade (SH) - Shade all day that is heavier than light shade  
 Woodland Shade (WSH) - Heavily shaded by closed canopy of trees with filtered sunlight
